Abstract

Since 2003, a stratified random summer bottom trawl survey was conducted by Spain in the NAFO Regulatory Area of Division 3L (Flemish Pass). The surveys were carried out by the R/V “*Vizconde de Eza*” using bottom trawl net type *Campelen*. Entire series of mean catches, biomass and length distribution for Greenland halibut, American plaice and witch flounder are presented for the period 2003-2013. Greenland halibut biomass and abundance estimates show an increasing trend along the whole period, reaching a maximum of mean catch and number in 2008. A great increase of small individuals (around 12-15 cm) can be seen in 2013. American plaice biomass and abundance estimates present an increasing trend since 2010. Regarding witch flounder, the biomass and abundance increased in 2013, but there is no a clear trend in the whole period 2003-2013.

KEYWORDS: Survey, Flemish Pass, Greenland halibut, American plaice, witch flounder.

Material and Methods

The Spanish surveys in Div. 3L of NAFO Regulatory Area (Flemish Pass) were initiated in 2003. The Research vessel “*Vizconde de Eza*” has carried out these surveys following the same procedures and using the same bottom trawl gear *Campelen 1800*. In 2003, the survey was carried out in spring (June) and it did not cover all strata adequately (69% of the total area prospected in 2006-2013). In 2004, the survey was carried out in August, for a period of nine days, and it covered only the 96%. In 2005, it was not possible to perform the survey due to problems with the winch of the ship; and in 2006, for the first time, an adequate prospecting survey was conducted in Division 3L with over 100 valid hauls. Table 1 presents the number of valid tows, the depth strata covered and the dates of the survey series. Figure 1 shows haul positions of Spanish surveys in NAFO Div. 3L in the period 2003-2013.

The survey area was stratified following the standard stratification schemes (Bishop, 1994). All surveys had a stratified random design following NAFO specifications (Doubleday, 1981). Hauls were allocated to strata proportionally to stratum size, with a minimum of two planned hauls per stratum and the trawl positions were chosen at random. A synoptic sheet of the survey with the vessel and gear characteristics is shown in Table 2. Biomass and abundance indices were calculated by the swept area method (Cochran, 1997), assuming catchability factor of 1.

The catch from each haul was sorted out and weighted by species and a randomly selected sample of each species was taken in order to measure it and to obtain the length distribution. For Greenland halibut, American plaice and witch flounder, each individual of the sample was measured to the total length to the nearest lower cm. and data are given in 2 cm intervals. We present on a yearly basis: the mean catch per haul, the stratified mean catch per haul, the

biomass with its variance per year and the length distribution in number per haul stratified mean catches by length, sex and year for each species in the period 2003-2013.

Biological studies (age, growth, feeding,...), oceanographic data and special studies (occurrence of marine mammals and sea birds) were collected from NAFO Regulatory area Div. 3L during the survey aboard *Vizconde de Eza*. The following formula was used to obtain the biomass from length distribution: $Weight = a (Length + 0.5)^b$.

Stratified mean catches and SD

The mean catch (\bar{y}_i) and the variance (Var_i) are calculated by stratum by the following formulas:

$$\bar{y}_i = \sum_{j=1}^{T_i} \frac{y_j}{T_i}, \quad i = 1, \dots, h$$

$$Var_i = \sum_{j=1}^{T_i} \frac{(y_j - \bar{y}_i)^2}{T_i - 1}, \quad i = 1, \dots, h$$

where:

y_j is the catch in haul j
 T_i is the number of hauls in the stratum i
 h is the total number of strata

and the stratified mean catch (\bar{y}_i^{str}) and the stratified variance (Var_i^{str}) by stratum are obtained as follow:

$$\bar{y}_i^{str} = \bar{y}_i n_i, \quad i = 1, \dots, h$$

$$Var_i^{str} = Var_i \frac{n_i^2}{T_i}, \quad i = 1, \dots, h$$

where:

n_i is the area of the stratum i , $i = 1, \dots, h$

Then the total stratified mean catch (\bar{Y}) and the variance (Var) by year are calculated according to the formulas:

$$\bar{Y} = \sum_{i=1}^h \frac{\bar{y}_i^{str}}{N}$$

$$Var = \sum_{i=1}^h \frac{Var_i^{str}}{N^2}$$

where:

$N = \sum_{i=1}^h n_i$ is the total area by year

The stratified standard deviation (SD) by year is calculated as the square root of the stratified variance by year.

Results

In 2013, the bottom trawl survey in Div. 3L (Flemish pass) of NAFO Regulatory Area was carried out on board R/V *Vizconde de Eza* using the usual survey gear (*Campelen 1800*) from July 30th to August 19th and following the same procedure as in previous years. A total of 107 hauls (7 of them null) were performed in a depth range of 117-1420 m. (Table 1).

Biological studies

Biological data (length, sex, sexual maturity, weight and stomach repletion degree) on 9 target species and other 79 species were collected from Div. 3L in 2013 (22102 individuals sampled).

Maturity and fecundity – 663 samples for histological maturity and fecundity of Greenland halibut, cod, American plaice and Atlantic wolffish (*Anarhichas lupus*) were taken.

Age and Growth – otoliths (1490 samples) of Greenland halibut, American plaice, roughhead grenadier, cod and Atlantic wolffish (*Anarhichas lupus*) were collected for growth studies.

Feeding studies were performed on some demersal species (*Notacanthus chemnitzii*, *Hydrolagus affinis* and *Harriotta Raleighana*) and 52 stomach contents were analysed from depths of 632 to 1408 m.

Hydrographic Studies

Temperature and salinity were measured in each haul by means of CTD ((SBE Se 25 SEALOGGER CTD). Hydrographic profile samplings were performed at 100 fishing stations in a depth range of 105-1394 m. The minimum and maximum observed temperatures were -0.51 and 4.02 °C respectively and the observed salinity range was 33.13 - 34.91 PSU. Results are presented in MEDS (Marine Environmental Data Service of Canada) every year.

Special studies

Benthic invertebrate

The study of benthic invertebrates was performed as a routine work during the survey (catch in weight and number, photographs and collection for study in the laboratory). This study will help us to have more knowledge about these species and their relation to the marine environment in the surveyed area.

Marine mammals and sea birds

Observations and incidental catches of marine mammals occasionally occurred were recorded during fishing time in the surveyed area of Flemish Pass. Occurrence, date, position, number, T^a, fishing time and other data were collected related to marine mammals throughout the survey. In 15 hauls, observations of 3 marine mammals species (*Physeter macrocephalus*, *Globicephala melas* and *Hyperoodon Ampullatus*) were recorded.

Regarding seabirds, information about species, and incidental catches was also collected in the surveyed area. This will help us get a better understanding of these species, their relation to the marine environment and the interaction of seabirds with fishing. *Fulmarus glacialis*, *Puffinus gravis*, *Puffinus griseus*, *Morus bassanus* and *Catharacta skua* were the most common seabird species.

Results for Greenland halibut, American plaice and witch flounder are presented in this report. The results for the rest of target species will be presented in other SCR in this SC meeting. The detailed results for Northern shrimp, the most abundant species in the catches of all surveys, were presented in Casas *et al.*, 2013.

Greenland halibut (*Reinhardtius hippoglossoides* Walbaum, 1792)

The Greenland halibut stock in Subarea 2 and Div. 3KLMNO is considered to be part of a biological stock complex, which includes Subareas 0 and 1. Abundance and biomass indices were available from research vessel surveys by Canada in Div. 2J+3KLMNO (1978-2012), EU in Div. 3M (1988-2012) and EU-Spain in Div. 3NO (1995-2012).

Catches increased sharply in 1990 due to a developing fishery in the NAFO Regulatory Area in Div. 3LMNO and continued at high levels during 1991-94. The fishable biomass declined to low levels in 1995-97 due to very high catches and high fishing mortality. It increased during 1998-2000 due to greatly reduced catches, much lower fishing mortality and improved recruitment. Biomass increased over 2004-2008 with decreased in fishing mortality. Survey data from 2008-2012 are variable but indicate stability. Current values remain below the levels of the late 1990s-early 2000s.

In 2003, a fifteen year rebuilding plan was implemented by Fisheries Commission for this stock (NAFO, 2013).

Mean catches and biomass

Table 3 shows the swept area, the tow number, the mean catches and their variance per haul and year for Greenland halibut. Table 4 and Figure 2 present the stratified mean catches per stratum with the total variance per year. Table 5 and Figure 3 present the abundance, the biomass per swept area per stratum and their total variance per year. Table 6 presents the length-weight relationships.

The biomass of the Greenland halibut has had an increase in the surveyed area along the whole period, mainly in 2008. However, in 2011 the biomass has decreased, reaching the same level as in 2006. Biomass increased again in 2013 but no to the level of 2009.

The biomass presents the same trend as mean catches since the year 2004. In 2003, the mean catch does not follow the same pattern; this was probably due to the less area covered in 2003 survey (Figures 2 and 3).

Figure 4 shows a map with the distribution of Greenland halibut catches per haul in 2013 Spanish 3L survey.

Length distribution

Table 7 and 8 present the stratified mean catches per haul length distribution for the Greenland halibut, by sex and year, with the number of samples in which there were length measures, the total number of individuals measured in these samples, the sampled catch and the range of lengths met, as well as the total catch of this species and the total valid hauls made in the survey. In 2013 a great increase of small individuals (around 12-15 cm) can be seen.

In Figures 5 and 6 the evolution along the years can be followed.

American plaice (*Hippoglossoides platessoides* Fabricius, 1780)

There was no fishing targeting American plaice in 1994 and it has been under moratorium since 1995. Catches increased after the moratorium until 2003 and began to decline afterwards. Biomass and SSB remain low compared to historic levels. There has been no good recruitment to the exploitable biomass since the mid-1980s. Based on available data, there is nothing to indicate a change in the status of the stock since the 2011 assessment (NAFO, 2013).

Mean catches and biomass

American plaice haul mean catches by stratum are presented in Table 9, including swept area, number of hauls and SD. Stratified mean catches per tow by stratum and year and their variance are presented in Table 10.

The entire time series (2003-2013) of biomass and their SD estimates of American plaice are shown in Table 11. Length-weight relationships are presented in Table 6.

The American plaice indices showed a general increasing trend in the prospected area since 2004 (Fig. 7 and 8). But in 2010 this increasing trend was broken and the value was below the 2006 value, following by an increase in 2011-2013. The highest values in the estimated biomass have been observed in the shallowest strata, in a range of depth from 93 to 274 meters. Figure 4 shows a map with the distribution of American plaice catches per haul in 2013 Spanish 3L survey.

Length distribution

Tables 12 and 13 present the stratified mean catches per haul length distribution by sex and year. They present also the number of samples in which length measurements were performed, the total number of individuals measured in

these samples, the sampled catch and the range of lengths found. The total catch of this species and the total valid hauls made in the survey are shown too. In Figures 6 and 9 the evolution along the years can be followed.

For this species, there is a quite good presence of small individuals (around 10-16 cm) since 2006. There is higher proportion of females than males.

Witch flounder (*Glyptocephalus cynoglossus* Linnaeus, 1758)

The fishery for witch flounder in NAFO Divisions 2J, 3K and 3L began in the early 1960s and increased steadily from about 1 000 t in 1963 to a peak of over 24 000 t in 1973. A moratorium on directed fishing on this stock was implemented in 1995 following drastic declines in catch from the mid-70s, and catches since then have been low levels of by-catch in other fisheries. From 1999 to 2004 catches were estimated to be very low, between 300 and 800 tons and from 2005-2012, catches averaged less than 150 tons.

No directed fishery to allow for stock rebuilding. By-catches of witch flounder in other fisheries should be kept at the lowest possible level (NAFO, 2013).

Mean catches and biomass

Table 14 shows the swept area, the tow number, the mean catches and their variance per haul and year for witch flounder. Table 15 and Figure 10 present the stratified mean catches per stratum with the total variance per year. Table 16 and Figure 11 present the abundance and biomass per swept area per stratum and their total variance per year. Parameters *a* and *b* estimated values of length-weight distribution are presented in Table 6. Figure 4 shows a map with the distribution of the witch flounder catches per haul in 2012 Spanish 3L survey.

Witch flounder indices show no clear trend throughout the period 2003-2012, the index peaked in 2010. However, biomass declined again in 2012. Estimated biomass ranged from 691 t in 2010 to 297 t and 298 t in 2003 and 2007 respectively; although most estimate results come from few strata. The stratified mean catches per stratum followed similar trends as the biomass and abundance indices (Fig. 10 and 11).

Length distribution

Table 17 and 18 present the stratified mean catches per haul length distribution for this species, by sex and year, with the number of samples in which there were length measures, the total number of individuals measured in these samples, the sampled catch and the range of lengths met, as well as the total catch of this species and the total valid hauls made in the survey. In Figures 6 and 12 we can follow the evolution along the years.

The highest recruitment was in 2003, but since then the number of younger individuals have declined.

TABLE 2.- Technical data of the Spanish survey in NAFO Division 3L for the period 2003-2013.

Procedure	Specification
Vessel	R/V “ <i>Vizconde de Eza</i> ”
GT	1400 t.
Power	1800 HP
Surveyed area	Div. 3L (depth < 1500 m, outside ZEE Canada)
Mean trawl speed	3 knots
Trawling time	30 minutes effective time
Fishing gear type	<i>Campelen 1800</i>
Headline	29.5 m
Groundrope	19.5 m
Type of groundrope	34 rockhopper
Floats	(2 x 39) + 10
Bridle	40 m (20 mm)
Vertical opening	4-5
Horizontal opening	26
Trawl doors	Polyvalent, 1400 Kg
Warp	20 mm
Warp to depth ratio	$22.287 * \text{Depth (m)}^{0.6667}$
Mesh size in the cod-end	44 mm
Type of survey:	Stratified random bottom trawl survey
Criterion to change position of a selected tow	Unsuitable bottom for trawling according to commercial fish information or ecosounder register. Information on gear damage from previous surveys.
Criterion to reject data from tow	<ul style="list-style-type: none"> - Severe tears in the gear - tears in cod-end - Less of 20 minutes tow - Bad behaviour of the gear
Daily period for fishing	6.00 to 22.00 hours
Target species	Greenland halibut, American plaice, Atlantic cod, roughhead grenadier, witch flounder, thorny skate, red fish, black dogfish, northern shrimp.

TABLE 3.- Swept area, number of hauls and **Greenland halibut** mean catch (Kg) and SD (**) by stratum. Spanish Survey on NAFO Div. 3L in the period 2009-2013, on board R/V "Vizconde de Eza".

Table 6.- Length-weight relationships in the calculation of biomass, for Division 3L (out ZEE Canada), 2006-2013 for **Greenland halibut, American plaice and witch flounder**. The equation is $\text{Weight} = a(\text{Length} + 0.5)^b$. To calculate the parameters for the indeterminate individuals, we used the total data (males+females+indeterminate individuals).
